

Paint is not Protection!

US Patent #5 081 171

Today's paint technology gives you a great looking finish, but is not made for our harsh environmental conditions and is prone to etching, fading and oxidation! This is the reason companies ship with protective wraps. You can polish and wax to restore the shine but even with weekly washes you cannot hope to keep that "Showroom Shine".

WHY WAXES DON'T LAST - Wax has very little resistance to many of today's detergents and are easily washed away. When heated by the sun or the daytime temperatures, waxes melt and can absorb contaminants such as dust, industrial fallout, exhaust fumes and other airborne particles actually trapping them in the surface when the coating rehardens. This creates a dull and dirty looking surface.

THE PPS PAINT PROCESS ELIMINATES THIS!

The Benefits of choosing the PPS Coating:

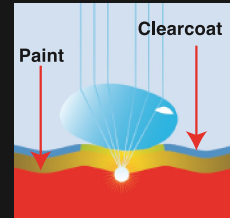

- Outperforms all others in independent testing
- Proven to last for over 150 washes
- Safe for all paints, clearcoats, fiberglass and gel coats
- A unique and proven patent for over 27 years
- Virtually maintenance free - no more waxing or polishing
- Protects surfaces from UV rays, pollutants, tree sap, bug & bird damage

The Patented System gives you deep down Protection!

PATENTED 2 STEP PROCESS

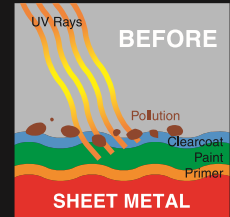

Rainwater beads on surfaces and is magnified. This speeds up the chemical degradation of any unprotected finishes.

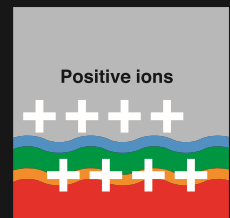

PPS CAN PREVENT THIS!

STEP ONE:

The polarizing lotion (Step#1) removes any dirt and harmful elements. It also chemically purges the pores of the painted surface.

This leaves a positive charge on the finish.

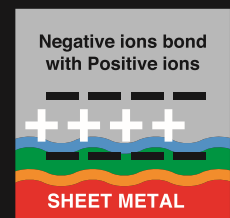

UNIQUELY SUPERIOR!

STEP TWO:

The negatively charged PTFE resins are applied (Step#2).

The polarized surfaces fuse together and form a unique crosslinked chemical bond and protective coating.

STRONG TO THE FINISH!

The World's Only Patented Process System for Paint Protection
